## Chapter 2

## Experimental

### 2.1 Instruments and Chemicals

Infrared spectra were recorded using Jasco ${ }^{\circledR}$ IR-810 infrared spectrometer and major bands were reported in wave number $\left(\mathrm{cm}^{-1}\right)$. Ultraviolet (UV) absorption spectra were recorded using a Hewlett-Packard ${ }^{\circledR}$ 8452A diode array spectrophotometer and principle bands ( $\lambda_{\max }$ ) were reported as wavelength ( nm ) and $\log \varepsilon$ in MeOH solution. Nuclear magnetic resonance spectra were recorded on 500 MHz Varian Unity Inova ${ }^{\circledR}$ spectrometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded at 500 MHz and 125 MHz respectively in $\mathrm{CDCl}_{3}$ using internal standard from the residual solvent signals at $\delta 7.26$ and 77.0 in ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra, respectively. Optical rotation was measured from $\mathrm{CHCl}_{3}$ solution with sodium D line ( 590 nm ) on Jasco ${ }^{\circledR}$ DIP-370 digital polarimeter. Solvents for extraction and chromatography were distilled at their boiling point ranges prior to use. Column chromatography was performed on silica gel $\left(\operatorname{Merck}^{\circledR}\right) 60(0.040-0.063 \mathrm{~mm})$. Preparative TLC was performed on Merck ${ }^{\circledR}$ silica gel $60 \mathrm{GF}_{254}$ plates and the detection of compounds was accomplished by exposure to UV light at 254 nm and/or by spraying with ferric chloride-perchloric acid or Dragendorff's spraying reagents.

### 2.2 Plant material

Roots of Tabernaemontana peduncularis were collected in May 2002 from Krabi province, Thailand. The plants were identified by Associate Professor Dr. Sanan Subhadhirasakul and voucher specimens of plant materials (Specimen No. SN-12102001-03) has been deposited in the Department of Pharmacognosy and Pharmaceutical Botany, Faculty of Pharmaceutical Sciences, Prince of Songkla University, Hat Yai, Songkhla, Thailand.

### 2.3 Extraction

The dried, coarsely-powdered roots of T. peduncularis ( 2.8 kg ) were macerated with methanol 8 L for three days and filtered; the filtrate was then evaporated under reduced pressure to give a syrupy mass. The marc was re-macerated with methanol ( 8 L ) four times, filtered and evaporated as before. The evaporates were combined to give a methanol extract $(250.56 \mathrm{~g})$. The methanol extract was extracted with $n$-hexane $(5 \times 200 \mathrm{ml})$, filtered and evaporated as before to give a $n$-hexane soluble extract $(24.76 \mathrm{~g})$. Then, the residual methanol extract $(185.95 \mathrm{~g})$ was repeatedly re-extracted with $2 \%$ sulfuric acid $(5 \times 200 \mathrm{ml})$, filtered sequentially through kieselgur. The acidified extracts were combined and extracted with $\mathrm{CHCl}_{3}(3 \times 200 \mathrm{ml})$ then evaporated under reduced pressure to give an acidified $\mathrm{CHCl}_{3}$ extract $(4.435 \mathrm{~g})$. The residual acidified extract was allowed to cool in an ice bath.

Scheme 2.1 Extraction of the crude alkaloid from the roots of T. peduncularis

Then the cooled acidified extract was made basic ( pH 9 ) with $25 \% \mathrm{NH}_{4} \mathrm{OH}$ and extracted with $\mathrm{CHCl}_{3}(6 \times 200 \mathrm{ml})$. The combined $\mathrm{CHCl}_{3}$ extract was washed with water $(2 \times 500 \mathrm{ml})$, dried with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated under reduced pressure to give the crude alkaloid $(3.847 \mathrm{~g})$. (The whole process are shown in Scheme 2.1)

### 2.4 Isolation and chemical investigation

### 2.4.1 Isolation of the crude alkaloid

The crude alkaloid $(3.00 \mathrm{~g})$ was separated by $\mathrm{SiO}_{2}$ column chromatography. The column was eluted with a step gradient of MeOH in $\mathrm{CHCl}_{3}$, started with $3 \% \mathrm{MeOH}$ in $\mathrm{CHCl}_{3}$ and increased the proportion of MeOH to pure MeOH . Fractions of 75 ml were collected and combined by using the pattern on TLC. Twelve fractions were obtained, R9TP A to R9TP L. Fractions that showed positive reaction to ferric chloride-perchloric acid spraying reagent or Dragendroff's spraying reagent and visualized by UV light at 254 nm were selected for further separation.

Scheme 2.2 Isolation of the crude alkaloid from T. peduncularis

### 2.4.2 Isolation of the selected fractions

### 2.4.2.1 Isolation of R9TP A

R9TP A ( 351.9 mg ) was separated by $\mathrm{SiO}_{2}$ column chromatography using EtOAc/n-hexane (1:4) as eluting solvent. Ten fractions were obtained, R9TP A1 to R9TP A10. Furthermore, R9TP A1 (139.8 mg) was selected to submit on preparative TLC. EtOAc/n-hexane (1:4) was used as a mobile phase to afford a compound, R9TP $01(43.7 \mathrm{mg}, 1.46 \%$ of crude alkaloid). Likewise, R9TP A2 (112.1 mg) was further rechromatographed by the same procedure as fraction R9TP A1 and the other compound, R9TP 03 ( $3.2 \mathrm{mg}, 0.11 \%$ of crude alkaloid) was obtained.

### 2.4.2.2 Isolation of R9TP B

Furthermore, R9TP B ( 452.5 mg ) was rechromatographed on $\mathrm{SiO}_{2}$ column chromatography using EtoAC/n-hexane (1:4) as an eluent. Ten fractions were obtained, R9TP B1 to R9TP B10 (As shown on Scheme 2.3). In addition, fraction R9TP B4 ( 15.0 mg ) was further separated by preparative TLC using EtOAc/n-hexane (1:4) as a mobile phase. Therefore, R9TP $07(10.0 \mathrm{mg}$, 0.33\% of crude alkaloid) was obtained. Moreover, fractions R9TP B5 and B6 were combined ( 27.7 mg ) and chromatographed on preparative TLC using EtOAc/nhexane (3:4) as a mobile phase.

Scheme 2.3 Isolation of fraction R9TP B

The separation process gave R9TP 08 ( $25.2 \mathrm{mg}, 0.84 \%$ of crude alkaloid). Likewise, R9TP B8 ( 40.5 mg ) was further chromatographed on preparative TLC using EtOAc/n-hexane (3:4) as a mobile phase to afford R9TP $10(29.8 \mathrm{mg}, 0.99 \%$ of crude alkaloid). Similarly, fraction R9TP B9 ( 35.1 mg ) was submitted on preparative TLC using EtOAc/n-hexane (1:1) as a mobile phase to afford R9TP 05 ( $25.5 \mathrm{mg}, 0.85 \%$ of crude alkaloid).

R9TP 07 exhibited the same spectroscopic data as R9TP 03 while R9TP 05 and R9TP 10 also revealed the same spectroscopic data.

### 2.4.2.3 Isolation of R9TP D

In the same way, R9TP D ( 209.3 mg ) was reseparated by $\mathrm{SiO}_{2}$ column chromatography using $\mathrm{EtOAc} / n$-hexane/Et 2 NH (2:8:0.2) as eluting solvent. Five fractions were obtained R9TP D1 to R9TP D5. Then, R9TP D2 ( 50.1 mg ) was submitted on preparative TLC using $\mathrm{EtOAc} / n$-hexane $/ \mathrm{Et}_{2} \mathrm{NH}$ (2:8:0.2) as a mobile phase to afford R9TP 17 ( $36.4 \mathrm{mg}, 1.21 \%$ of crude alkaloid).

### 2.4.2.4 Isolation of R9TP E

R9TP E ( 356.5 mg ) was further separated by $\mathrm{SiO}_{2}$ column chromatography using $\mathrm{MeOH} / \mathrm{EtOAc} / n$-hexane $(0.5: 5: 5)$ as eluting solvent. Seven fractions were obtained, R9TP E1 to R9TP E7. In addition, R9TP E3 ( 42.3 mg ) was submitted on preparative TLC using $\mathrm{MeOH} / \mathrm{EtOAc} / n$-hexane (0.5:5:5) as a mobile phase to afford R9TP 13 ( $5.6 \mathrm{mg}, 0.19 \%$ of crude alkaloid).

### 2.4.2.5 Isolation of R9TP G

Furthermore, R9TP G (160.6 mg) was reseparated by $\mathrm{SiO}_{2}$ column chromatography. The column was eluted by $\mathrm{EtOAc} / 2$-propanol/ $\mathrm{Et}_{2} \mathrm{NH}$ (8.5:1:0.5). Thus, five fractions were obtained, R9TP G1 to R9TP G5. Finally, R9TP G2 ( 45.6 mg ) was submitted on preparative TLC using EtOAc/2propanol/Et $\mathrm{E}_{2} \mathrm{NH}$ (8.5:1:0.5) as a mobile phase to afford R9TP $20(35.0 \mathrm{mg}, 1.17 \%$ of crude alkaloid).
