Chapter	
1. Introduction	1
1.1 Background and rationale	1
1.2 Literature review	5
1.3 Objectives	9
2. Methodology	10
2.1 Spline functions to fit demographic data	10
2.2 Registered mortality data in Thailand using thematic maps	13
2.3 Terrorism incidence rates of events in southern Thailand using dynamic maps	16
2.4 Thailand's election data on thematic maps using local projection	17
2.4.1 Thematic maps	18
2.4.2 Vote swings	20
3. Manuscripts	22
(a) Spline Interpolation of Demographic Data Revisited	23

Contents (cont.)

List of Tables

Tables	Page
The first published manuscript	
Table 1 Cumulative age-specific fertility data	25
Table 2 Thai male population in 2000	25
Table 3 Cumulative age-specific mortality data for Australian women in 1901	26
The second published manuscript	
Table 1 Mortality rates and proportions of ill-defined causes of mortality for males and females aged less than 85 years in Thailand, 1999-2001	31
Table 2 Super-districts with the highest percentages of ill-defined mortality outside the hospital for males and females, Thailand, 1999-2001	35
The third published manuscript	
Table 1 Regions used in analysis of victim violence incidence in Deep South of Thailand	42

List of Figures

Figures	Page
Figure 2.1 The re-production of the work by Rauch & Stockie (2008) for a calculation of cubic spline function to fit given data. (a) is a given data and (b) is a result of fitted cubic spline function	12
Figure 2.2 Grouping of means according to the locations of their comparison confidence intervals	14
Figure 2.3 An example of a stacked bar chart for comparing confidence intervals	15
Figure 2.4 The screenshots of Google Earth with different viewing angles and added graphics such as polygon bars and images	17
Figure 2.5 Radial scaling used in creating variable-scale map	19
Figure 2.6 The comparison between a normal- scaled map and a variable-scaled map for voting results of Thai election in 2005	20
Figure 2.7 A simple calculation for the proportion of vote swings between two elections	21
The first published manuscript	
Figure 1 Natural cubic spline interpolations of fertility and population densities	25
Figure 2 Spline interpolations of cumulative mortality for Australian women in 1901	26

List of Figures (cont.)

Figures	Page
The second published manuscript	
Figure 1 Percentage of ill-defined and unknown causes of mortality outside the hospital among males and females aged less than 85 in Bangkok, 1999-2001	32
Figure 2 Age-adjusted percentage of ill-defined mortality outside the hospital for males and females aged less than 85 in Bangkok, 1999-2001	32
Figure 3 Model results for the percentage of ill-defined and unknown causes of mortality outside the hospital for males and females aged 0-84 years, Thailand, 1999-2001	33
Figure 4 Percentage of ill-defined mortality outside the hospital for males and females aged less than 85 in Thailand, 1999-2001	34
The third published manuscript	
Figure 1 Estimates of annual incidence rates per 100,000 population of injury to civilian non-Muslim residents of the terrorism target area in Southern Thailand, classified by gender and region after adjusting for year (2004–2009) and age group (<15, 15–44, 45+). The horizontal red line denotes the overall mean incidence rate and the grey horizontal lines denote the rates for males and females, respectively. The vertical lines denote 95% confidence intervals for differences between the incidence rates and the overall mean.	43

List of Figures (cont.)

Figures	Page
Figure 2	43
Figure 3	45

Simple thematic map of the 15 regions in the Southern Thailand terrorism target area, using three colors to classify the terrorism risk for males (left boxes) and females (right boxes) as above average (red), below average (blue), or not evidently different from average (green). The numbers in the legend denote the median incidence rates per 100,000 populations in each of the three groups.

Google Earth displays of GIS map of terrorism incidence rates to non-Muslim residents in regions of Southern Thailand. The upper panel shows the location of the target area in the Malay Peninsula viewed from a specified location above the Earth's surface, with the graphical user interface in the sidebar to the left of the map that appears when a user double-clicks on the Google Earth icon, and with the graph in Figure 1 appearing as a screen overlay. The lower panel shows additional features that appear when the user selects further menu options, including the simple thematic map in Figure 2, and corresponding color-coded extruded polygons with ground overlays and pop-up boxes giving further details about region characteristics

List of Figures (cont.)

Figures	Page
The fourth published manuscript	
Figure 1 Timeline of changes in main political parties in Thailand from 2005-2011	55
Figure 2 Maps of Thailand with the coloring themes for parties winning percentages of votes, and colored dots of parties winning MPs in each province	55
Figure 3 Radial scaling used in creating variable-scale map	56
Figure 4 A simple calculation for the proportion of votes swings between two elections	56
Figure 5 Representation of the numbers of MPs in a form of colored dots, comparing majority votes using background colors for each province in 2005, 2007, and 2011 elections	57
Figure 6 The transferred percentages of votes between participating parties in Thailand in a pair of 2005 and 2007 elections, and in a pair of 2007 and 2011 elections	58
Figure 4.1 Thai male population in 2000 in (a) a tabular format, (b) a bar chart created from the data, and (c) a natural cubic spline fitting the data	60
Figure 4.2 Thai populations in 2000 for some provinces, interpolated by a natural cubic spline functions with added knots	61

List of Figures (cont.)

Figures	Page
Figure 4.3 Italian fertility rate, 1955 with (a) re-production of McNeil, Trussell, & Turner (1977) in a solid curve and a single-piece polynomial in a dashed curve, and (b) a cubic spline function with extra knots	62
Figure 4.4 Probability density for Australian female mortality in 1901 from three techniques, a conventional natural cubic spline in a dashed curve, a natural cubic spline with Hyman filter (re-production of Smith, Hyndman, & Wood, 2004), and a natural cubic spline with an extra knot	63
Figure 4.5 The comparison between the use of confidence intervals and thematic maps for ill-defined mortality rates in Bangkok between 1999 and 2001	64
Figure 4.6 The comparison between the use of confidence intervals with thematic maps and a three-dimensional map on Google Earth with stacked bar charts and screen overlays the incidence rates of civilian injuries from terrorism events in the southern part of Thailand from 2004 to 2009	65
Figure 4.7 The comparison between (a) an inset map and (b) a local projection to focus on a clustered area around Bangkok for Thailand's Election in 2007	66

List of Figures (cont.)

Figures	Page
Figure 4.8 The comparison between (a) re-production of a thematic map by Thailand Political Data (2012) and (b) a thematic map using plotted color points for Thailand's Election in 2007	67
Figure 4.9 The thematic map with plotted points of the election result in the north-east region of Thailand in 2007, highlighting at Mukdahan	68
Figure 4.10 The thematic map with plotted points of the elections in 2007 and 2011 indicating the separation of political preferences between the north-east and the south-west of Thailand, and the tendency of two-party system	69
Figure 4.11 The comparison between (a) a table and (b) bubble plots to display vote swings from the elections from 2005 to 2007	69
Figure 4.12 The screenshots of Gapminder show the achievement of eighth grade students in different countries. The periods of the data, the sizes of the bubbles, the variations of indicators, and the types of viewing can be changed dynamically (Gapminder Foundation, 2006).	71
