Introduction	1
Literature Review	3
1. Palm Olein	3
2. Lipases	3
3. Immobilized lipases	6
4. Kinetics of reaction catalyzed by immobilized lipases	7
5. MAG production and application	8
6. The influence of reaction condition on glycerolysis	9
6.1 Sources of lipases	9
6.2 Initial water content	9
6.3 Glycerol/triacylglycerols molar ratio	9
Materials and Methods	10
1. Materials	10
2. Immobilization	12
3. Glycerolysis	12
Result and Discussion	13
1. Immobilization of lipase	13
2. Modeling of lipase catalytic reaction	14
3. Parameters estimation	20
4. Simulations of the effect of water concentration	21
5. Simulations of the effect of glycerol concentration	22
6. Simulations of the effect of triacylglycerol concentration	23
7. Simulations of the effect of triacylglycerol and glycerol ratio	24
8. Optimum conditions	25
Conclusions	28

Table 1 Effect of enzyme loading on immobilization of lipase PS with Accurel	13
Table 2 Parameters in the model of glycerolysis reaction	17
Table 3 Summary of model for glycerolysis of palm oil by immobilized lipase	27

List of Figure

	Page
Figure 1 Types of reaction catalyzed by lipases	5
Figure 2 The main reactions of glycerolysis of palm olein (R: palmitin or olein)	14
Figure 3 Comparison between calculated and experimental results (symbols) of glycerolysis reaction. Reaction condition: triacylglycerol 7.16 mM; glycerol 19.14 mM; water 9.89 mM; immobilized lipase 600 mg	18
Figure 4 Comparison between calculated and experimental results (symbols) of monoacylglycerol production in glycerolysis reaction with various enzyme concentrations (200 to 600 mg)	19
Figure 5 Simulation results of effect of water concentration (8 to 12% in glycerol) on the time dependence of monoacylglycerol.	20
Figure 6 Simulation results of effect of glycerol concentration (10.74 to 21.48 mM) on the time dependence of monoacylglycerol.	21
Figure 7 Simulation results of effect of palm olein concentration (1.19 to 9.55 mM) on the time dependence of monoacylglycerol.	22
Figure 8 Simulation results of effects of palm olein concentration on the initial production rate (rMAG) and yield of monoacylglycerol at each glycerol concentration.	23
Figure 9 Comparison between calculated and experimental results (symbols) of glycerolysis reaction with the optimal initial production rate of monoacylglycerol.	25
Figure 10 Comparison between calculated and experimental results (symbols) of glycerolysis reaction with the optimal yield of monoacylglycerol.	26
Figure 11 Standard curve of palmitic acid.	33
Figure 12 TLC/FID chromatogram of standard oil compositions.	34
