#### Abstract

The azoimine functionalized ligand 3-amino-2-(phenylazo)pyridine (3aazpy) was synthesized. The reaction between 3aazpy and $\mathrm{RuCl}_{3} 3 \mathrm{H}_{2} \mathrm{O}$ in $\mathrm{N}, \mathrm{N}$ dimethylformamide afforded two isomers of the $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes. The complexes have been chromatographically separated. They have been characterized by elemental analyses, Infrared spectroscopy, NMR spectroscopy, UV-Vis absorption spectroscopy and cyclic voltammetry. The 3aazpy ligand and 2-amino-3(phenylazo)pyridine (2a3pp) have been confirmed by X-ray crystallography.

3-amino-2-(phenylazo)pyridine

2-amino-3-(phenylazo)pyridine

## ACKNOWLEDGEMENTS

I would like to thank my advisor, Asst. Prof. Dr. Kanidtha Hansongnern who provided support, knowledge, useful discussion and kindness during the laboratory work and the preparation of this thesis.

I am very grateful to Asst. Prof. Dr. Chaveng Pakawatchai for X-ray crystallographic data and helpful advice.

I would like to thank examination committee members, Assoc. Prof. Dr. Suthatip Siripaisanpipat, Dr. Walailak Puetpaiboon for their valuable time. I am grateful to Department of Chemistry, Faculty of Science, Prince of Songkla University for all necessary laboratory apparatus and chemicals supplies used throughout this research.

I would like to thank Dr. Uraiwan Changsaluk and Dr. Luksamee Sahavisit for helpful suggestion of this research.

I am very grateful to the Center of Excellence for Innovation in Chemistry (PERCH-CIC): Commision on Higher Education, Ministry of Education and Graduate School, Prince of Songkla University for financial support.

I would like to thank all members of CH 439. Their friendship, kindness and help have been valuable to me.

Finally, I would like to thank Mr. Ruk and Mrs. Sunee Sansook, my parent for love, care and encouragement.

## THE RELEVANCE OF THE RESEARCH WORK

In this research, two isomers of ruthenium(II) complexes with the bidentate ligand, 3-amino-2-(phenylazo)pyridine (3aazpy) were synthesized and characterized by spectroscopic techniques. The redox properties of these compounds were studied by cyclic voltammetric technique.

Result from this work helps us to understand a variety of techniques used for the synthesis and characterization of compounds. In addition, these compounds may be developed into producing more effective catalysts, medicinal drug and other applications.

## 1 INTRODUCTION

### 1.1 Introduction

The chemistry of azoimine ( $-\mathrm{N}=\mathrm{N}-\mathrm{C}=\mathrm{N}-$ ) ligand has been studied for several years. The advantage of the azoimine functional unit is that it has a strong ability to stabilize low valence metal redox states, such as $\mathrm{Cu}(\mathrm{I}), \mathrm{Ru}(\mathrm{II}), \mathrm{Os}(\mathrm{II})$. Thus the chemistry of complexes having azoimine ligand induced some researchers to synthesize a new ligand containing azoimine unit. 2-(phenylazo)pyridine or azpy is one of the most interesting ligand in the azoimine functional unit because of its $\sigma$ donor and $\pi$-acceptor properties.

The ruthenium(II) complexes with azoimine ligands were investigated because of their potential application in many chemical reactions. For example, the complexes of $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ (azpy $=2$-(phenylazo)pyridine) have been used as catalysts in epoxidation reactions (Barf, et al., 1995). Its structure is shown in Figure 1 .

Figure 1. The structure of 2-(phenylazo)pyridine, (azpy)

In addition, the cis- and trans- isomeric complexes of $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$ showed in the vitro cytotoxicity activity in tumor-cell lines (Velders, et al., 2000). Moreover, the complexes of $\alpha-\mathrm{Ru}(\text { azpy })_{2}\left(\mathrm{NO}_{3}\right)_{2}$ showed strong binding to DNAmodel bases (Holtze et al.,2000). The $\left[\mathrm{Ru}(\mathrm{papm})_{2} \mathrm{Cl}_{2}\right]$ complex which consists another azoimine functionalized ligand, 2-(phenylazo)pyrimidine, has an important activity of antibiotics and antimicrobials (Santra, et al., 1999).

Figure 2. The structure of 2-(phenylazo)pyrimidine (azpym).

In this work, it was of interest to synthesize the complexes of $\mathrm{Ru}(\mathrm{II})$ with 3-amino-2-(phenylazo)pyridine (3aazpy) ligand. The 3aazpy is an azpy related ligand with containing an amino group $\left(-\mathrm{NH}_{2}\right)$ at the third position on the pyridine ring. The 3aazpy compound acts as a bidentate ligand that can coordinate to a metal ion through the lone electron pairs of the pyridine and the azo nitrogen atoms, forming a stable chelating 5 -membered ring. The 3aazpy derived from the condensation reaction between 2, 3-diaminopyridine and nitrosobenzene provides the $\pi$-acidic azoimine fragment for metal coordination. The complexes of ruthenium(II) with 3aazpy were synthesized. Theoretically, the type of the $\mathrm{RuL}_{2} \mathrm{Cl}_{2}$, complex formula has five geometrical isomers: trans-cis-cis (tcc); trans-trans-trans (ttt); cis-trans-cis (ctc); cis-cis-trans (cct); and cis-cis-cis (ccc) by considering the order of the coordinating pairs of $\mathrm{Cl}, \mathrm{N}($ pyridine $)$, and $\mathrm{N}($ azo $)$, respectively. From this work, we were able to isolate only two of the five isomers. The chemical properties of these ruthenium(II) complexes having the general formula $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ were described. The structure of the 3aazpy is shown in Figure 3.

Figure 3. The structure of 3-amino-2-(phenylazo)pyridine (3aazpy)

### 1.2 Review of Literatures

Krause and Krause, (1980) studied dichlorobis(2-(phenylazo)pyridine)ruthenium(II) complexes, $\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$. Three isomers of $\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ were obtained from reaction between 2-(phenylazo)pyridine (azpy) and $\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$. There were two cis-isomers ( $\alpha$ and $\beta$ ) and one trans-isomer ( $\gamma$ ). These complexes were characterized by IR spectroscopy, UV-Visible absorption spectroscopy and ${ }^{13} \mathrm{C}$ NMR techniques. The results from cyclic voltammetric data showed that the azpy ligand was a better $\pi$-acceptor than the bpy ligand (bpy $=2,2^{\prime}$-bipyridine).

azpy

Krause and Krause, (1984) synthesized and characterized the complexes of $\mathrm{Ru}(\mathrm{Naz})_{2} \mathrm{Cl}_{2}$ (Naz $=2$-(4'-nitrophenyl)azo)pyridine by infrared spectroscopic, UV-Vis absorption spectroscopic and differential pulse voltammetric techniques. In comparison with $\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}$ complexes, the Naz ligand can stabilize ruthenium(II) better than the azpy ligand. This was due to the inductive of the nitrogen group in Naz ligand as it is stronger $\pi$-acceptor property than the azpy ligand.

Naz

Sheldon and Barf, (1995) studied the ruthenium-catalyzed epoxidation of olefins using a variety of nitrogen-containing ligands. They reported that in the epoxidation of trans-stibene with $\mathrm{NaIO}_{4}$ as oxygen donor and $\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}$ complexes was used as catalysts.

Santra, et al., (1999) describe the synthesis, spectral studied, redox properties and single crystal X-ray structure of $\left[\mathrm{Ru}(\mathrm{aapm})_{2} \mathrm{Cl}_{2}\right]$ (aapm $=2$ (arylazo)pyrimidine). They synthesized a new member of azoimine family, 2(arylazo)pyrimidine (aapm). Pyrimidine was chosen because of its higher $\pi$-acidity than that found in conventional widely used pyridine bases and also due to its biochemical importance.

aapm

Velder, et al., (2000) describe the remarkably different cytotoxicity data of three isomeric dichlororuthenium(II) complexes of the type $\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$, in which azpy stands for the bidentate ligand, 2-(phenylazo)pyridine. Although the mechanism of action antitumor-active ruthenium compounds was not fully understood, it was thought that, similar to the platinum drugs, the chloride complexes can be hydrolyzed in vivo, allowing the Ru to finally bind to the nucleobases of the DNA.

Hotze, et al., (2000) reported the new water-soluble compound $\alpha$ $\left[\mathrm{Ru}(\text { azpy })_{2}\left(\mathrm{NO}_{3}\right)_{2}\right]$. The solid-state structure of this compound has been determined by X-ray crystallography. The binding of DNA-model bases 9-ethylguanine (9egua) and guanosine (guo) to this complex has been studied.

Santra, et al., (2001) reported two classes of mixed-ligand ruthenium(II)-arylazopyrimidine complexes incorporating one and two 2(arylazo)pyrimidine (aapm) ligand. Triphenylphosphine and chloride act as coligands. $\mathrm{Ru}\left(\mathrm{PPh}_{3}\right)_{3} \mathrm{Cl}_{2}$ was used as starting complex of ruthenium. In dichloromethane, the mixing of $\mathrm{Ru}\left(\mathrm{PPh}_{3}\right)_{2}($ aapm $) \mathrm{Cl}_{2}$ whereas the reaction in EtOH under reflux yields $\left[\mathrm{Ru}\left(\mathrm{PPh}_{3}\right)_{2}(\text { aapm })_{2}\right]^{2+}$ as the major species. The complexes were characterized by spectroscopic studies and in one case, $\mathrm{Ru}\left(\mathrm{PPh}_{3}\right)_{2}($ aapm $) \mathrm{Cl}_{2}$, the structure was established by X-ray crystallography.

Santra, et al., (2001) reported first structurally characterized coordination polymer of silver(I) with 2-(arylazo)pyrimidine (aapm). 2(arylazo)pyrimidine belonged to neutral binucleating $\mathrm{N}, \mathrm{N}$ '-chelating ligand. They posses active azoimine function and were efficient agents to stabilize low valent metal redox state. Presence of metal-related pyrimidine-N was responsible for self-assembly to generate coordination polymer.

Senapoti, et al., (2002) reported the synthesis, spectral studies, redox properties and single-crystal X-ray structure of one of the isomers of osmium(II) complexes of 2-(arylazo)pyrimidines (aapm). The electronic properties of $\mathrm{OsCl}_{2}$ (papm) $)_{2}$ were different from that of ruthenium(II)-arylazopyrimidine complexes and have been interpreted from theoretical calculations using EHMO approximation.

Kamar, et al., (2002) described the synthesis and properties of a series of chromium(II) and chromium(III) complexes of the isomeric $2-[(\mathrm{N}-$ arylamino)phenylazo]pyridine ligands. Optical properties of these were markedly different from those of the parent chromium-pap complexes.

2-[(N-arylamino)phenylazo]pyridine

Lu, et al., (2003) described the synthesis and X-ray characterization of $t c c-$ and $c c c-\left[\mathrm{Ru}(\text { paiq })_{2} \mathrm{Cl}_{2}\right]$ (paiq $=1$-phenylazoisoquinoline) complexes. A study of some coordinated bond lengths of these complexes with other similar complexes of ruthenium(II) has been summarized and compared.

1-(phenylazo)isoquinoline

Hansongnern, et al., (2003) reported the synthesis and single-crystal Xray structure of 2-(4'-N,N-diethylaminophenylazo)pyrimidine. This compound containing pyridine with the azo moiety.

2-(4'-N,N-Diethylaminophenylazo)pyrimidine

Velders, et al., (2004) reported the isolation of the fourth isomer, $\delta$ $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$. The isomeric structure of $\delta-\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ has been determined by ${ }^{1} \mathrm{H}$-NMR spectroscopy and single-crystal X-ray diffraction analysis.

Bohle, et al., (2007) reported the synthesis and single-crystal X-ray structure of trans-bis(2-aminophenyl)diabenzene. This compound is a member of the azobenzene family.

trans-Bis(2-aminophenyl)diazene

### 1.3 Objective

1. To synthesize the 3-amino-2-(phenylazo)pyridine (3aazpy) ligand and the isomeric complexes of $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$
2. To characterize and to analyze the chemistry of the 3aazpy ligand and the $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes.

## 2 MATERIALS AND METHODS

### 2.1 Materials

### 2.1.1 Chemical substances

## Materials from Fluka

2,3-Diaminopyridine, $\mathrm{C}_{5} \mathrm{H}_{7} \mathrm{~N}_{3}$, A.R. grade
Nitrosobenzene, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NO}$, A.R.grade
Tetrabutylammonium hexafluorophosphate, $\left[\mathrm{NBu}_{4}\right] \mathrm{PF}_{6}$,
A.R.grade

Lithium chloride anhydrous, LiCl, A.R. grade

## Materials from Merck

Silica gel 60 ( $0.040-0.063 \mathrm{~nm}$ ) GF 254
Sodium hydroxide, NaOH , A.R. grade

## Materials from Aldrich

Ruthenium(III) chloride hydrate, $\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$, A.R. grade

### 2.2 Instruments

### 2.2.1 Melting Point Apparatus

Melting points of all compounds were measured on an Electrothermal Melting point apparatus (Electrothermal 9100).

### 2.2.2 Elemental Analysis

Elemental analytical data were obtained by using a CE Instruments Flash 1112 Series EA CHNS-O Analyzer

### 2.2.3 Infrared Spectroscopy

Infrared spectra were collected by using KBr pellets on a Perkin Elmer Spectrum GX FT-IR Spectrophotometer from $400-4,000 \mathrm{~cm}^{-1}$.

### 2.2.4 UV-Visible Absorption Spectroscopy

UV-Visible absorption spectra were recorded in the range 200-800 nm by Hewlett Peckard 8425A diode array spectrophotometer.

### 2.2.5 Nuclear Magnetic Resonance Spectroscopy

1D and 2D NMR spectra were recorded in $\mathrm{CDCl}_{3}$ solution with Fourier Transform NMR spectrometer 500 MHz , Model UNITY INOVA, Varian. Tetramethylsilane $\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{4}\right)$ was used as an internal standard.

### 2.2.6 Cyclic Voltammetry

Electrochemical experiments were carried out using cyclic voltammetric technique. The program was Echem 1.5.1. Cyclic voltammograms were obtained using a glassy carbon working electrode, a platinum wire auxiliary electrode and a platinum disc reference electrode. The supporting electrolyte was tetrabutylammonium hexafluorophosphate, $\left[\mathrm{NBu}_{4}\right] \mathrm{PF}_{6}$, (TBAH) in dichloromethane. At the end of each experiment, ferrocene was added as an internal standard. The argon was bubbled through the solution prior to each measurement.

### 2.2.7 X-ray Diffractometry

The structure of 3-amino-2-(phenylazo)pyridine ligand and 2-amino-3(phenylazo)pyridine were determined by Smart APEX CCD diffractometer with the Xtal 3.7.1 program system.

### 2.3 Synthesis of ligand

## 3-amino-2-(phenylazo)pyridine (3aazpy)

The 3-amino-2-(phenylazo)pyridine (3aazpy) ligand was prepared by condensation reaction. 2,3-Diaminopyridine ( $214 \mathrm{mg}, 2 \mathrm{mmol}$ ) reacted with nitrosobenzene ( $217 \mathrm{mg}, 2.1 \mathrm{mmol}$ ) in the mixture of $30 \mathrm{M} \mathrm{NaOH}(3 \mathrm{~mL})$ and 35 mL of benzene solution. The reaction mixture was heated in the water bath at $60-65^{\circ} \mathrm{C}$ with stirring for 30 min and then refluxed for 14 h . The mixture was extracted with benzene. The brown reaction mixture was evaporated to 3 mL and transferred to silica gel column packed with hexane. The two red-orange band was eluted with hexaneethyl acetate (9:1) mixture, which were collected and evaporated to dryness. The total yield is 37 \%

### 2.4 Syntheses of complexes

## $c t c$ and $c c c-\left[\operatorname{Ru}(3 a a z p y)_{2} \mathrm{Cl}_{2}\right]$

The $c t c$ and $c c c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes were prepared by mixing of $\mathrm{RuCl}_{3} .3 \mathrm{H}_{2} \mathrm{O}$ ( $20.7 \mathrm{mg}, 0.10 \mathrm{mmol}$ ) and 3-amino-2-(phenylazo)pyridine ligand ( 59 $\mathrm{mg}, 0.29 \mathrm{mmol})$ in dimethyl formamide ( 10 mL ) at reflux for 8 h . The solvent was removed. The residue was purified by column chromatography. The complexes were eluted with a hexane:chloroform (3:2) mixture. The blue band and dark-green band were eluted respectively. The pure complexes were collected and evaporated to dryness.

The isolated product consisted of two isomers (ctc and ccc[ $\left.\left.\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]\right)$. The yield of ctc isomer is $22 \%(13 \mathrm{mg})$ and that of $c c c$ isomer is $16 \%(9 \mathrm{mg})$.

## 3 RESULTS AND DISCUSSION

### 3.1 Syntheses of ligand and complexes

The 3-amino-2-(phenylazo)pyridine (3aazpy) ligand was synthesized by the condensation of the 2,3-diaminopyridine and the nitrosobenzene in $1: 1$ mole ratio in the mixture of sodium hydroxide and benzene solution. The reaction was refluxed for 14 h . Then, the mixture was extracted with benzene and purified by column chromatography. The two red-orange product were isolated.

The isolated product consisted of two compounds, 3-amino-2(phenylazo)pyridine (3aazpy) and 2-amino-3-(phenylazo)pyridine (2a3pp). The reaction is shown in equation (1)

2,3-diaminopyridine

nitrosobenzene

NaOH
Benzene

3-amino-2-(phenylazo)pyridine (3aazpy)

2-amino-3-(phenylazo)pyridine (2a3pp)

The yield of 3aazpy is $20 \%$ and that of the 2 a 3 pp is $17 \%$. The physical properties of the 3aazpy and 2a3pp are listed in Table 1.

Table 1. The physical properties of 3aazpy and 2a3pp

| Compound | Physical properties |  |  |
| :---: | :---: | :---: | :---: |
|  | Appearance | Color | Melting point $\left({ }^{\circ} \mathrm{C}\right)$ |
| 3aazpy | solid | dark red-orange | $117-119$ |
| 2a3pp | solid | red-orange | $148-149$ |

The melting point of the 3aazpy ligand was in the range $117-119{ }^{\circ} \mathrm{C}$. The solubility of 10 mg of ligand was tested in 5 mL of various solvents. The ligand was very soluble in almost all solvents $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{CHCl}_{3}, \mathrm{CH}_{3} \mathrm{CN}\right.$, EtOAc, Acetone).

The 3-amino-2-(phenylazo)pyridine (3aazpy) ligand is a bidentate ligand containing the azoimine functional group, $-\mathrm{N}=\mathrm{N}-\mathrm{C}=\mathrm{N}$-, which has $\mathrm{N}-\mathrm{N}$ donor atoms. Reaction of 3aazpy with $\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ in DMF produced the complexes of $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$. The reactions afforded two isomers. They were ctc and ccc$\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes. The coordination number of these complexes was sixcoordinated. The physical properties of the complexes are summarized in Table 2.

Table 2. The physical properties of the $\left[\mathrm{Ru}(3 \mathrm{aazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes

| Compound | Physical properties |  |  |
| :---: | :---: | :---: | :---: |
|  | Appearance | Color | Melting point $\left({ }^{\circ} \mathrm{C}\right)$ |
| $c t c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ | solid | blue | $>330$ |
| $c c c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ | solid | purple | $>330$ |

The solubility of 10 mg of $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes was tested in 10 mL of various solvents. The results showed that complexes were slightly soluble in $\mathrm{MeOH}, \mathrm{EtOH}$, toluene, and acetone. It was completely soluble in dichloromethane, chloroform, and acetonitrile but insoluble in ether and water.

### 3.2 Characterization of ligand and complexes

The chemistry of the 3aazpy ligand, 2a3pp and complexes was determined by using these techniques

### 3.2.1 Elemental analysis

3.2.2 Infrared spectroscopy
3.2.3 UV-Visible absorption spectroscopy
3.2.4 Nuclear Magnetic Resonance spectroscopy (1D and 2D)
3.2.5 Cyclic Voltammetry
3.2.6 X-ray Crystallography

### 3.2.1 Elemental analysis

Elemental analysis is a technique to study the composition of elements in a compound. It is shown that the analytical data of the compounds corresponded to the calculated values. The elemental analysis data are listed in Table 3.

Table 3. Elemental analysis data of the 3aazpy ligand, 2a3pp and the $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes

| Compounds | $\% \mathrm{C}$ |  | $\% \mathrm{H}$ |  | $\% \mathrm{~N}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Calc. | Found | Calc. | Found | Calc. | Found |
| 3aazpy | 66.65 | 66.01 | 5.08 | 5.11 | 28.26 | 27.76 |
| 2a3pp | 66.65 | 66.80 | 5.08 | 5.15 | 28.26 | 27.99 |
| ctc-[Ru(3aazpy) $\left.)_{2} \mathrm{Cl}_{2}\right]$ | 46.48 | 46.43 | 3.55 | 3.60 | 19.71 | 19.43 |
| ccc-[Ru(3aazpy) $\left.)_{2} \mathrm{Cl}_{2}\right]$ | 46.48 | 46.45 | 3.55 | 3.57 | 19.71 | 19.52 |

### 3.2.2 Infrared spectroscopy

Infrared spectroscopy is a technique to study the functional groups of compounds. Infrared spectra were collected by using KBr pellets in the range 4000$400 \mathrm{~cm}^{-1}$. The important vibrational frequencies are $\mathrm{C}=\mathrm{C}, \mathrm{C}=\mathrm{N}, \mathrm{N}=\mathrm{N}$ (azo) stretching modes and C - H bending in monosubstituted benzene.

## Infrared spectroscopy of the 3aazpy ligand

The infrared spectroscopic data of the 3aazpy ligand are listed in Table 4.

Table 4. Infrared spectroscopic data of the 3aazpy ligand

| Vibration modes | Frequencies $\left(\mathrm{cm}^{-1}\right)$ |
| :---: | :---: |
| C=C, C=N stretching | $1613(\mathrm{~s})$ |
|  | $1476(\mathrm{~m})$ |
| N=N stretching | $1399(\mathrm{~m})$ |
| C-H bending | $802(\mathrm{~m})$ |
| in monosubstituted benzene | $773(\mathrm{~s})$ |
|  | $687(\mathrm{~m})$ |

$\mathrm{s}=$ strong, $\mathrm{m}=$ medium

The infrared spectrum of 3aazpy exhibited intense bands at 1600-400 $\mathrm{cm}^{-1}$. The ligand showed medium peaks at $1613-1476 \mathrm{~cm}^{-1}$, corresponding to $\mathrm{C}=\mathrm{C}$ and $\mathrm{C}=\mathrm{N}$ stretching in the pyridine ring of the ligand. The sharp band at $1399 \mathrm{~cm}^{-1}$ was assigned to the $\mathrm{N}=\mathrm{N}$ stretchings, which was had a lower frequency than that in azpy ( $1421 \mathrm{~cm}^{-1}$ ).This stretching mode was used to be considered the $\pi$-acid property in azo complexes. It was found that the $\mathrm{N}=\mathrm{N}$ bond of the free azpy ligand is stronger than that of 3aazpy ligand. In addition, this vibrational band is expected to be of higher frequency than that in the complexes due to the coordination of ligand to ruthenium metal. The infrared spectrum is shown in Figure 4.

Figure 4. IR spectrum of 3aazpy.

## Infrared spectroscopy of the 2a3pp

The infrared spectroscopic data of the 2a3pp are listed in Table 5.

Table 5. Infrared spectroscopic data of the 2a3pp

| Vibration modes | Frequencies $\left(\mathrm{cm}^{-1}\right)$ |
| :---: | :---: |
|  |  |
| C=C, C=N stretching | $1617(\mathrm{~s})$ |
| $1599(\mathrm{~s})$ |  |
| $1474(\mathrm{~m})$ |  |
| $1446(\mathrm{~m})$ |  |

$\mathrm{s}=$ strong, $\mathrm{m}=$ medium

The infrared spectrum of 2 a 3 pp exhibited intense bands at 1620-400 $\mathrm{cm}^{-1}$. The compound showed medium peaks at $1617-1446 \mathrm{~cm}^{-1}$, corresponding to $\mathrm{C}=\mathrm{C}$ and $\mathrm{C}=\mathrm{N}$ stretching in pyridine ring. The sharp band at $1399 \mathrm{~cm}^{-1}$ was assigned to the $\mathrm{N}=\mathrm{N}$ stretchings, which had a lower frequency than in azpy $\left(1421 \mathrm{~cm}^{-1}\right)$. The infrared spectrum is shown in Figure 5.

Figure 5. IR spectrum of 2a3pp.

## Infrared spectroscopy of the $\left[\mathrm{Ru}(3 \mathrm{Bazpy})_{2} \mathbf{C l}_{2}\right]$ complexes

The infrared spectroscopic data of the complexes are listed in Table 6.

Table 6. Infrared spectroscopic data of $\left[\mathrm{Ru}(3 \mathrm{aazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes

| Vibration modes | Frequencies $\left(\mathrm{cm}^{-1}\right)$ |  |
| :---: | :---: | :---: |
|  | $c t c-\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ | $c c c-\left[\mathrm{Ru}(\mathrm{L})_{2} \mathrm{Cl}_{2}\right]$ |
| $\mathrm{C}=\mathrm{C}, \mathrm{C}=\mathrm{N}$ stretching | $1585(\mathrm{~m})$ |  |
|  | $1536(\mathrm{~m})$ | $1584(\mathrm{~m})$ |
|  | $1422(\mathrm{~m})$ | $1535(\mathrm{~m})$ |
|  |  | $1442(\mathrm{~m})$ |
| $\mathrm{N}=\mathrm{N}$ stretching | $1317(\mathrm{~s})$ | $1305(\mathrm{~s})$ |
|  | $1285(\mathrm{~s})$ | $1287(\mathrm{~s})$ |
|  |  | $840(\mathrm{~m})$ |
| C-H bending in | $767(\mathrm{~m})$ | $840(\mathrm{~m})$ |
| monosubstituted benzene | $689(\mathrm{~m})$ | $762(\mathrm{~m})$ |
|  |  | $688(\mathrm{~m})$ |

$\mathrm{s}=$ strong, $\mathrm{m}=$ medium

In the complexes, the infrared spectra exhibited medium peaks at $1585-1422 \mathrm{~cm}^{-1}$. These frequencies were assigned to the $\mathrm{C}=\mathrm{C}$ and the $\mathrm{C}=\mathrm{N}$ vibrational modes. The $v(\mathrm{~N}=\mathrm{N})\left(1305-1317 \mathrm{~cm}^{-1}\right)$ is red shift by $94-82 \mathrm{~cm}^{-1}$, compared to the free ligand value $\left(1399 \mathrm{~cm}^{-1}\right)$ which is a good indication of N -coordination.

It is noted that the $\mathrm{N}=\mathrm{N}$ stretching modes in the complexes appeared at lower frequency than that in the free ligand. It was due to the $\pi$-back bonding occurring from the $t_{2 g}$ orbitals of metal to the $\pi^{*}$ orbitals of azo. From this result, the bond order of $\mathrm{N}=\mathrm{N}$ (azo) decreased and the bond length increased, so the vibrational energies decreased. In addition, $v(\mathrm{~N}=\mathrm{N})$ of the $c t c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ appeared at the higher frequency than the $c c c-\left[\operatorname{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$. It indicated that the 3aazpy in ctc could accept electrons from the $\mathrm{t}_{2 \mathrm{~g}}(\mathrm{Ru})$ orbitals to its $\pi^{*}$ orbitals less than $c c c(c c c>c t c)$. The infrared spectra of the $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ isomers are shown in Figure 6 and 7, respectively.

The $\mathrm{N}=\mathrm{N}$ stretching mode $\left[\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ appears between 1303-1323 $\mathrm{cm}^{-1}$ and an azo mode at $1424 \mathrm{~cm}^{-1}$ (free azpy) indicates conjugation the shift to lower energy in the complexes indicates less double-bond character in the $\mathrm{N}=\mathrm{N}$ group. The $\mathrm{N}=\mathrm{N}$ stretching mode in $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ gave similar results to those in [ $\left.\mathrm{Ru}(\mathrm{azpy})_{2} \mathrm{Cl}_{2}\right]$ (Inorg Chem. 1980, 19, 2600-2603).

Figure 6. IR spectrum of $c t c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$.

Figure7. IR spectrum of $c c c-\left[\operatorname{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$.

### 3.2.3 UV-Visible absorption spectroscopy

UV-Visible absorption spectroscopy is a technique to study the electronic transitions of compound. The electronic absorption spectra of the complexes in five solvents were recorded in the range of 200-800 nm. The spectral data are given in Table 7. The absorption spectra of all compounds in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{CHCl}_{3}$, $\mathrm{CH}_{3} \mathrm{CN}$, DMF and DMSO are shown in Figure 8 to Figure 11.

Table 7. UV-Visible absorption spectroscopic data of the ligand, 2a3pp and the complexes.

| Compounds | $\lambda_{\text {max }} \mathrm{nm},\left(\varepsilon^{\mathrm{a}} \times 10^{4} \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | $\mathrm{CHCl}_{3}$ | $\mathrm{CH}_{3} \mathrm{CN}$ | DMF | DMSO |

| $c c c-\left[\mathrm{Ru}(3 \mathrm{aazpy})_{2} \mathrm{Cl}_{2}\right]$ | $\begin{aligned} & 355(2.1) \\ & 592(1.3) \end{aligned}$ | $\begin{aligned} & 361(1.6) \\ & 584(0.8) \end{aligned}$ | $\begin{aligned} & 347(1.4) \\ & 576(0.7) \end{aligned}$ | $\begin{aligned} & 351(2.0) \\ & 580(1.0) \end{aligned}$ | $\begin{aligned} & 351(1.6) \\ & 578(0.8) \end{aligned}$ |

[^0]UV-Visible spectral studies of the free ligand displayed absorption at 276-288 $\mathrm{nm}\left(\varepsilon \approx 11200 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ which was assigned to $\pi \longrightarrow \pi^{*}$ transition and the band in visible region, $406-427 \mathrm{~nm}\left(\varepsilon \approx 7600 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ was assigned to $\mathrm{n} \longrightarrow \pi^{*}$. These bands are due to the intraligand charge transition. Figure 8 shows the UVVisible absorption spectrum for the 3aazpy ligand in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvent and Figure 9 shows UV-Visible absorption spectrum for the 2 a 3 pp in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvent.

The two cis complexes, ctc-[Ru(3aazpy) $\left.)_{2} \mathrm{Cl}_{2}\right]$ and $c c c-$ $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ displayed intense bands in UV region within the range $327-361 \mathrm{~nm}$, intraligand charge transfer transition and at 576-597 nm, metal-to-ligand charge transfer transition. The electronic spectra of cis complexes in the visible region (576597 nm ) which existed in two isomeric forms. The cis complexes displayed two different intense band characters. The most intense bands were in the range of 327361 nm and the less intense bands were in the range of 576-597 nm. Figure 10 and 11 show the UV-Visible absorption spectra for all the two complexes in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvent.

Figure 8. UV-Visible absorption spectrum of 3aazpy in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.

### 3.2.4 Nuclear Magnetic Resonance spectroscopy (1D-2D)

Nuclear Magnetic Resonance (NMR) spectroscopy is a technique to determine the molecular structure of a compound. The structures of ligand and complexes were investigated by using 1D and 2D NMR spectroscopic techniques ( ${ }^{1} \mathrm{H}$ NMR, ${ }^{1} \mathrm{H}^{1}{ }^{1} \mathrm{H}$ COSY NMR, ${ }^{13} \mathrm{C}$ NMR, DEPT NMR and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR). The NMR spectra of all compounds were recorded in $\mathrm{CDCl}_{3}$ on UNITY INOVA 500 MHz . The tetramethylsilane $\left(\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{4}\right)$ was used as an internal reference.

The 3-amino-2-(phenylazo)pyridine (3aazpy) has ten protons on the molecule. The ${ }^{1} \mathrm{H}$ NMR spectrum of 3aazpy showed seven signals (Figure 12). The highest field signal was assigned to $\mathrm{H} 11\left(-\mathrm{NH}_{2}\right)$. The most downfield of H 6 was due to the nitrogen atoms which was located close to it. The protons H 4 and H 5 appeared as multiplet peak at 7.1 ppm . The signal of proton H 9 and H 10 showed as multiplet peaks at the same position due to both protons being located close to each other. In the phenyl ring, the proton H 8 were two equivalent protons. The signal occurred as a doublet peak at 7.9 ppm . This resonance appeared at the lower field than the proton H9 and H10 because it located next to the azo nitrogen, the ${ }^{1} \mathrm{H}$ NMR spectrum of the 3aazpy ligand was shown in Figure 12. In addition, the peak assignment was supported by using simple correlation ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy. The ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR signals are presented in Figure 13.

The ${ }^{13} \mathrm{C}$ NMR (Figure 14) results corresponded to those from DEPT NMR (Figure 15), which showed only methane carbon signals. The ${ }^{13} \mathrm{C}$ NMR spectrum of the 3aazpy ligand gave 9 signals for 11 carbons. The quaternary carbon C 2 of the pyridine ring appeared at the most downfield. The signal at 146 ppm was due to the quaternary carbon C 7 on the phenyl ring. The intense peak at 139 ppm referred to the quaternary carbon C 4 . The signal of carbon C 6 occurred at the lower field than that of other methane carbons because it is located next to the nitrogen atoms. The carbon signals at 122 and 129 ppm were attributed to the two equivalent carbon C8 and C9. The signals of carbon C3, C5, and C10 appeared at 139, 125, and 131 ppm , respectively. The ${ }^{13} \mathrm{C}$ NMR signals assignments were based on the ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$

HMQC NMR spectrum (Figure 16), which exhibited a correlation between ${ }^{1} \mathrm{H}$ NMR spectrum and ${ }^{13} \mathrm{C}$ NMR spectrum.

Figure 16. ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum of 3aazpy in $\mathrm{CDCl}_{3}$.

The 2-amino-3-(phenylazo)pyridine ( 2 a 3 pp ) has ten protons on the molecule. The ${ }^{1} \mathrm{H}$ NMR spectrum of 2 a 3 pp showed eight signals (Figure 17). The highest field signal was assigned to $\mathrm{H} 11\left(-\mathrm{NH}_{2}\right)$. The most downfield of H 6 was due to the nitrogen atoms which was located close to it. The proton $\mathrm{H} 4(\delta=8,2 \mathrm{ppm})$ and $\mathrm{H} 5(\delta=8,7.5 \mathrm{ppm})$ appeared as a doublet of doublet peak. In the phenyl ring, the proton H 8 were two equivalent protons. The signal occurred as a doublet of doublet at 7.8 ppm . This resonance appeared at the lower field than the proton H 9 and H 10 because it located next to the azo nitrogen, the ${ }^{1} \mathrm{H}$ NMR spectrum of the 2 a 3 pp was shown in Figure 17. In addition, the peak assignment was supported by using simple correlation ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectroscopy. The ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR signals are presented in Figure 18.

The ${ }^{13} \mathrm{C}$ NMR (Figure 19) results corresponded to those from DEPT NMR (Figure 20), which showed only methane carbon signals. The ${ }^{13} \mathrm{C}$ NMR spectrum of the 2a3pp gave 9 signals for 11 carbons. The quaternary carbon C 2 of the pyridine ring appeared at the most downfield. The signal at 151 ppm was due to the quaternary carbon C 7 of the phenyl ring. The peak at 131 ppm referred to the quaternary carbon C3. The signals of carbon C6 occurred at a lower field than that of other methane carbons because it is located next to the nitrogen atoms. The carbon signals at 122 and 129 ppm were attributed to the two equivalent carbon C 8 and C 9. The signals of carbon $\mathrm{C} 4, \mathrm{C} 5$, and C 10 appeared at 138,113 , and 130 ppm , respectively. The ${ }^{13} \mathrm{C}$ NMR signals assignments were based on the ${ }^{1} \mathrm{H}^{13} \mathrm{C}$ HMQC NMR spectrum (Figure 21), which exhibited a correlation between ${ }^{1} \mathrm{H}$ NMR spectrum and ${ }^{13} \mathrm{C}$ NMR spectrum.

Figure 21. ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC NMR spectrum of 2a3pp in $\mathrm{CDCl}_{3}$.

The ${ }^{1} \mathrm{H}$ NMR spectrum of the $c t c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complex showed only one set of protons similar to the free ligand. This result indicated that the complex was a symmetric molecule ( $\mathrm{C}_{2}$-symmetry). Moreover, the individual protons in the molecule showed different chemical shifts. The ${ }^{1} \mathrm{H}$ NMR spectrum of the ctc$\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ showed nine signals (Figure 22). It is interesting to note that the spectrum of the complex was divided into two parts (Table 11). The downfield portion was due to the pyridine protons ( $\mathrm{H} 4, \mathrm{H} 5, \mathrm{H} 6$ ) and the upfield signals referred to phenyl protons (H8, H9, H10). The most downfield signal was assigned to H6. This is because of the influence of nitrogen atoms in the pyridine ring. The singlet peak at the highest field was referred to H 11 . The signal of proton H 6 in the pyridine rings occurred at the lowest field due to the influence of coordinated nitrogen atoms.

The ${ }^{13} \mathrm{C}$ NMR of $c t c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ is shown in Figure 24. The result of spectrum corresponded to the DEPT NMR spectrum (Figure 25). This trend is also found in free ligand. However, in complex, each signal slightly shifted to lower field or higher field than free ligand. The downfield signals at $157 \mathrm{ppm}, 156 \mathrm{ppm}$, and 155 ppm were assigned to three quaternary carbons $\mathrm{C} 2, \mathrm{C} 7$, and C 3 , respectively. Moreover, the ${ }^{13} \mathrm{C}$ NMR signals assignment were based on the ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC spectrum (Figure 26 ).

The $c c c-\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ is $\mathrm{C}_{1}$-symmetrical and is expected to exhibit two sets of protons (Figure 27). This is indeed observed. The spectra showed that the pyridine protons are mostly affected when compared to the phenyl protons. The H6(b) and $\mathrm{H} 4(\mathrm{a}, \mathrm{b})$ signals are shifted downfield by approximate 1 ppm while, $\mathrm{H} 9(\mathrm{a}, \mathrm{b})$ and H10(a,b) are shifted upfield from those of the free ligand. Because the greater $\pi$ backbonding interaction to azo group will increase the electron density in the phenyl ring, this provided higher field phenyl protons. The pyridine protons H6(b) and H6(a) were observed at different chemical shifts. The proton H6 in pyridine ring a, appeared at the lower field than pyridine ring b , because it was trans to the $\mathrm{N}=\mathrm{N}$ withdrawing group while proton H 6 in pyridine ring b was trans to Cl . In addition, the proton signals in $-\mathrm{NH}_{2}$, ring a and ring b , showed the same effect of the trans withdrawing group. The assignments of ${ }^{1} \mathrm{H}$ NMR were confirmed by using the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectrum (Figure 28).

The ${ }^{13} \mathrm{C}$ NMR spectrum is shown in Figure 29. The DEPT spectral data (Figure 30) showed only signals of methane carbons and supported the ${ }^{13} \mathrm{C}$ NMR result.

### 3.2.5 Cyclic Voltammetry

Electrochemical properties of all the complexes were studied by cyclic voltammetry at a glassy carbon working electrode and were examined in dichloromethane using tetrabutylammonium hexafluorophosphate (TBAH) as supporting electrolyte at the scan rate of $100 \mathrm{mV} / \mathrm{s}$. Voltammetric data are given in Table 12 and selected voltammograms are shown in Figure 32 to 35. The voltammograms displayed $\mathrm{Ru}^{\text {IIIIII }}$ couple at the positive side and ligand reductions at the negative side. The potentials were compared with the potential of a ferrocene couple.

In this experiment, different scan rates were used to check the couple $\Delta \mathrm{Ep}$ of the redox reaction. The couple having equal anodic current ( $\mathrm{i}_{\mathrm{pa}}$ ) and cathodic current ( $\mathrm{i}_{\mathrm{pc}}$ ) was referred to as a reversible couple. On the other hand, the unequal currents were referred unequally transfer of reduction and oxidation peaks. This led to an irreversible couple. When different scan rates were applied, these currents gave equal anodic and cathodic currents at higher scan rates, which led to quasi-reversible couple.

Table 12. Cyclic voltammetric ${ }^{a}$ data for 3aazpy ligand, 2a3pp and the two complexes in 0.1 M TBAH dichloromethane at scan rate of $100 \mathrm{mV} / \mathrm{s}$.

| Compound | $\mathrm{E}_{1 / 2}(\mathrm{~V})\left(\Delta \mathrm{E}_{\mathrm{p}}(\mathrm{mV})\right)$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Oxidation |  | Reduction |  |
| 3 aazpy | $0.57{ }^{\text {b }}$ |  | -1.78 (96) |  |
| 2a3pp | $0.99{ }^{\text {b }}$ |  | -1.75 (94) |  |
| ctc-[ $\left.\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ | $1.61{ }^{\text {b }}$ | 0.96 (70) | -0.79 (105) | -1.18(115) |
| $c c c-\left[\mathrm{Ru}(3 \mathrm{aazpy})_{2} \mathrm{Cl}_{2}\right]$ | $1.70{ }^{\text {b }}$ | 0.85 (95) | -0.89 (150) | -1.29 (135) |

${ }^{\mathrm{a}} \mathrm{E}_{1 / 2}=\left(\mathrm{E}_{\mathrm{pa}}+\mathrm{E}_{\mathrm{pc}}\right) / 2$, where $\mathrm{E}_{\mathrm{pa}}$ and $\mathrm{E}_{\mathrm{pc}}$ are anodic and cathodic peak potentials, respectively; $\Delta E_{p}=E_{p a}-E_{p c} ;{ }^{b}$ anodic peak potential, $V$

In the potential range +0.5 to +1.5 V at a scan rate of $100 \mathrm{mV} / \mathrm{s}$ in dichloromethane, one electron oxidation response was observed corresponding to the $\mathrm{Ru}(\mathrm{II}) \longrightarrow \mathrm{Ru}($ III $)$ couple. The oxidation process is shown in equation (1).

$$
\begin{equation*}
\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2} \longrightarrow \mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}^{+}+\mathrm{e}^{-} \tag{1}
\end{equation*}
$$

The ctc isomer showed a slightly higher $\mathrm{Ru}(\mathrm{III}) / \mathrm{Ru}(\mathrm{II})$ couple $(0.11 \mathrm{~V})$ than that of the $c c c$ isomer. These were also supported by electronic spectral data.

In the potential range 0 to -2.0 V , reductive responses were observed under similar conditions using a glassy carbon working electrode. The reduction potentials were compared with the results from the free ligand. The free ligand showed one reversible two electron reduction responses with peak to peak separation at 96 mV , corresponding to the couple in equation (2)

The potential of this couple was -1.78 V . All the two complexes displayed two reversible, two electron reduction, one reversible, one electron oxidation and one irreversible peak of one electron.

Moreover, the reduction potential showed a positive shift from the free ligand value. The first reduction couple of the ctc complex ( -0.79 V ) occurred at a higher potential than that in the $c c c$ complex $(-0.89 \mathrm{~V})$. These results showed that the ctc isomer accepted electron better than the other isomer. In addition, it could be concluded that the 3aazpy ligand in the ctc complex was more easily reduced than the ccc complex.

In the $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ complexes, the ability of 3aazpy ligand to stabilize the complex is as follow:

$$
c c c<c t c
$$

In addition, The results of voltammetry were supported by the electronic spectral data shown in Table 13.

Table 13. Comparison of electronic and redox properties of $\left[\mathrm{Ru}(3 \mathrm{aazpy})_{2} \mathrm{Cl}_{2}\right]$ complexes

| Properties | $c t c$-isomer | $c c c$-isomer |
| :---: | :---: | :---: |
| $\mathrm{Ru}(\mathrm{III}) / \mathrm{Ru}(\mathrm{II}), \mathrm{E}_{1 / 2}(\mathrm{~V})$ | 0.96 | 0.85 |
|  |  |  |
| MLCT band, $\lambda_{\max }(\mathrm{nm})$ | 582 | 592 |

The oxidation potentials of each complexes are positive than that of the $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right](+0.71 \mathrm{~V})$ (Jullapun, 2004). The present set of $\mathrm{Ru}(\mathrm{III}) /(\mathrm{II})$ redox potential data of $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ are higher than $\left[\mathrm{Ru}(\text { azpy })_{2} \mathrm{Cl}_{2}\right]$. This suggests that the $\pi$-acidity order of the ligand is arranged follow:
3aazpy > azpy

Figure 32. Cyclic voltammogram of 3aazpy in $0.1 \mathrm{M} \mathrm{TBAH} \mathrm{CH} \mathrm{Cl}_{2}$ at scan rate $100 \mathrm{mV} / \mathrm{s}$.

Figure 35. Cyclic voltammogram of $c c c-\left[\mathrm{Ru}(\text { ( aaazpy })_{2} \mathrm{Cl}_{2}\right]$ in $0.1 \mathrm{M} \mathrm{TBAH} \mathrm{CH}_{2} \mathrm{Cl}_{2}$ at scan rate $100 \mathrm{mV} / \mathrm{s}$.

### 3.2.6 X-ray Crystallography

X-ray crystallography is the most important technique to identify the geometry of compounds. The single crystals of both 3-amino-2-(phenylazo)pyridine and 2-amino-3-(phenylazo)pyridine were grown to obtain the suitable X-ray quality crystals for structure determination. X-ray diffraction data were collected on the APEX CCD diffractometer with the Xtal 3.7.1 program system and equipped with graphite monochromatized Mo $\mathrm{K} \alpha$ radiation $(\lambda=0.71073)$ at 293 K .
(a) X-ray structure of 3-amino-2-(phenylazo)pyridine

The single crystals of 3-amino-2-(phenylazo)pyridine were obtain by slow evaporation of a dichloromethane solution. The solid state structure of 3-amino-2-(phenylazo)pyridine is shown in Figure 36. The crystallographic data are shown in Table 14. Selected bond parameters are listed in Table 15.

In the title compound, the benzene ring ( $\mathrm{C} 6-\mathrm{C} 11$ ), the azo group (N3$\mathrm{N} 4)$, and the substituted pyridine ring are not coplanar in the same plane. The angle between the planes of the pyridine ring and the azo group (C5-N3-N4) is 4.2(1) ${ }^{\circ}$, that between planes of the pyridine ring and the benzene ring is $19.59(6)^{\circ}$. The N3-N4 distance of the title compound is $1.265(2) \AA$, greater than that of the protonated azpy (1.248(4) $\AA)(P a n n e e r s e l v a m, ~ K ., ~ e t ~ a l ., ~ 2000) ~ a n d ~ c o m p a r a b l e ~ w i t h ~ t r a n s-b i s(2-~$ aminophenyl)diazene (1.2641(18)A) (Bohle, D. S., et al., 2007). In addition the bond length of C5-N3 $1.400(2) \AA$ is relative short compare with trans-bis(2aminophenyl)diazene (Bohle, D. S., et al., 2007), It indicates that there are some delocalization of electron density into the $\mathrm{N}=\mathrm{N} \pi^{*}$ orbitals.

Figure 37. The structure of 2-amino-3-(phenylazo)pyridine.

## 4 CONCLUSION

The azoimine functionalized ligand 3-amino-2-(phenylazo)pyridine (3aazpy) was synthesized and reacted with $\mathrm{RuCl}_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ in DMF under refluxing condition. Two isomers of the composition $\left[\mathrm{Ru}(3 \text { aazpy })_{2} \mathrm{Cl}_{2}\right]$ have been chromatographically separated and are established as having cis-trans-cis (ctc) and cis-cis-cis (ccc) configurations with reference to the order of coordination pairs as Cl ; N (pyridine), N and $\mathrm{N}($ azo $), \mathrm{N}$ '. All of compounds were characterized by using elemental analysis, Infrared spectroscopy, UV-Visible absorption spectroscopy, 1D and 2D NMR spectroscopy and their electrochemical properties were studied by cyclic voltammetry. The solid state molecular structure of the two compounds, 3aazpy and 2a3pp were determined by X-ray crystallography.

From the results of elemental analysis, the analytical data of the compound corresponded to the calculated values.

The ligand exhibited a sharp band at $1399 \mathrm{~cm}^{-1}$, corresponding to an $\mathrm{N}=\mathrm{N}$ stretching mode. In the two complexes, $v(\mathrm{~N}=\mathrm{N})$ was red shifted by $80-90 \mathrm{~cm}^{-1}$, which was a good indication of N -coordination. Solution electronic spectra of the complexes revealed that the $c t c$ and $c c c$ complexes exhibited highly intense MLCT transitions. The energy of the MLCT transition is an allowed transition. The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ and DEPT NMR spectra between the ligand and complexes were compared in order to study the structures and the stereochemistry of the compounds. Results of 2D NMR experiments, ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H} \operatorname{COSY}$ and ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HMQC, corresponded with the 1D NMR data. Redox studies of the 3aazpy revealed that the free ligand displayed one quasireversible two electron reduction at -1.78 mV . Nonetheless, the reduction potential of the ruthenium complexes showed a positive shift from the free ligand.

The X-ray structural studies confirmed both structures of 3aazpy and 2a3pp.

3aazpy
2a3pp
